GATE MANAGEMENT SYSTEM

The **gate management system** is a complete system, which can manage, control and monitor an entire vehicle gate logs and all related equipment. It helps organizations manage the daily visitors to their premises and also saves all the data of the concerned person coming in the premises and out of the premises.

WHAT IS THE OBJECTIVE OF A GATE MANAGEMENT SYSTEM?

○ User friendly

the features are designed by the interface and it ensures that is completely easy to the end user. The new and modified system will also be responsive to all traffic volumes.

○ Role based access

The system will have a role based system and the user will have an access based on his privilege levels.

○ Workflow

different stages of the vehicle movement would be accessed and supported by the system in the premises.

○ Easy to Maintain

decisions should be based on the real time data such as active vehicle on the campus, notification provided to the ware house to prepare for the next shipment and average time should be provided for unloading and loading of goods.

○ Better to maintain

the system would be easier to maintain and would be flexible to add new features and frequently modernized in the future.

USER MANAGEMENT

Different users have access to different roles and will have permission for certain activities like an admin user would have access to set up systems, make configuration changes, create and delete users. A gate operator will have permission to create pass, the supervisor will have permission to oversee the operations. The user management will have the flexibility to add, remove and modify users based on specific roles.

This helps the user with Data security as the data is not passed to any un-authorized person, as people who have an access can only get the data, and the objective of role-based data will be achieved.

Upon the entry of the truck, the gate operator will create a gate pass for the truck driver, which will have his relevant information

PRODUCT MASTER

The product master management has the abilities to create different product category, add different product category, set rate for the product, to configure standard sizing parameter for the product. All this data is fetched by SAP which is integrated with the system.

Since it is integrated with the system, it creates data visibility as the data is fetched from the cloud and ensures the right product, right characteristics are being brought into the organization and makes it more efficient. Also when you are gathering all the information through central data system you are getting better visibility. It is also easy to understand what is coming inside the premises and what is going out of the premises

When a truck is coming in the campus to deliver, or collect products or materials, the Gate Management System can fetch the product information from the SAP.

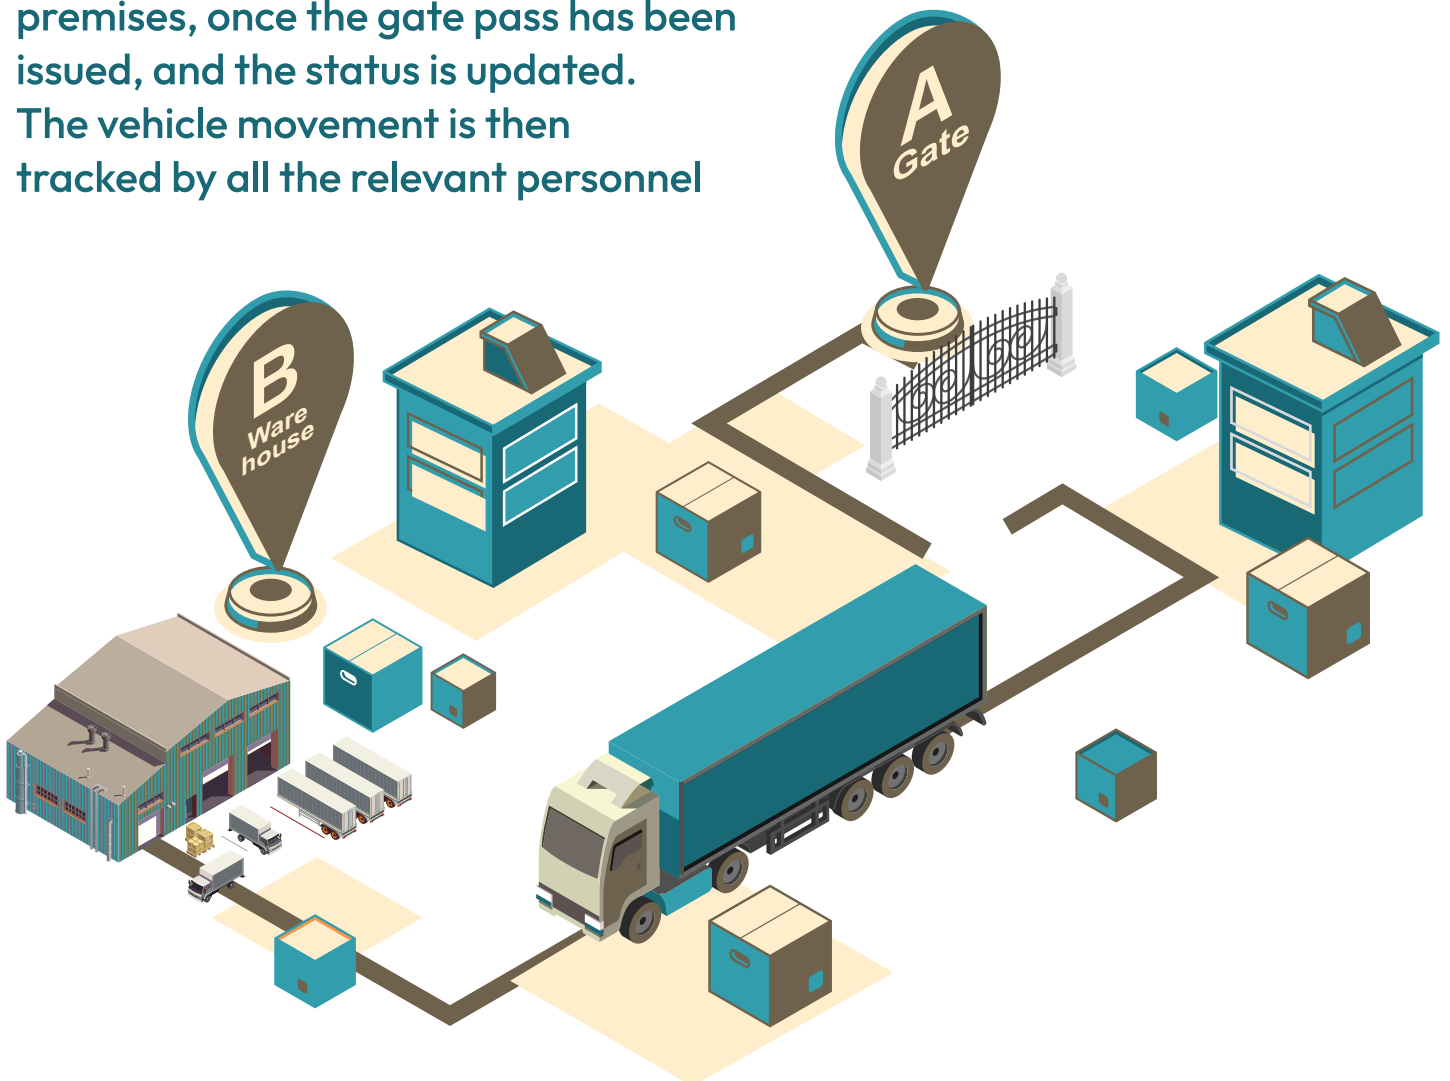

GATE OPERATIONS

Gate operations- every vehicle that is passing, the gate operator will create pass for them at the gate and all the information of the truck's driver such as name, license number, contact number and photo would be recorded and then the truck will be allowed to pass once the system has got the information.

The system will also have an option to authenticate truck using ANPR OR RFID reader and this would provide better workflow as the vehicle movement would be accessed by the system and provides better visibility as the warehouse operator would be able to know which truck is passing by the information collected.

The truck is only allowed to enter the premises, once the gate pass has been issued, and the status is updated. The vehicle movement is then tracked by all the relevant personnel

WAREHOUSE OPERATIONS

Warehouse operations- once the gate operator allows the truck to come inside the warehouse, the warehouse operator will get an update so that the loading/unloading process is started. Once that is done, the warehouse operator would mark the transaction as complete. The loading zone will receive a notification for their loading equipment and the gate operator will know that the unloading process is done.

This feature will provide added security as, for instance, when the driver takes longer than the usual time to return to the gate, the operator can ascertain the cause of such delays, intentional or otherwise, and take pro-active measures.

As soon as the vehicle movement starts, the warehouse operator is notified through the system, which allows him to start to prepare for the loading/unloading of material.

Solution

Dispatch Management For India's Largest RMC Company

Visitor Management and weighing automation system for World's second largest refinery

Weighing automation and Visitor Management System for Largest cement company in Uganda

Visitor Management and weighing automation System for largest oil and gas exploration company in Nigeria

PIMS (Plant Information Management) Enhanced plant information management system, streamlining data insights and boosting operational efficiency.

LIMS (Laboratory Management) and inventory management solution for complete tyre testing and R&D lab.

ARCHIRODON

Comprehensive weighing automation solutions across global EPC operations, tailored for efficient project execution.

Complete port logistics movement monitoring solution to enhance security and visibility.

Godrej Agrovet- farmer management system for palm oil production
Godrej Construction- weighing automation across all sites in Maharashtra region

Secure gate management | Weighing automation
Quality testing process management | Dispatch management solution
